X. Computation of SGPA & CGPA

Every student will be awarded points out of maximum 10 points in each subject. (based on 7 Points Scale). Based on the Grade points obtained in each subject the Semester Grade Point Average (SGPA) and then Cumulative Grade Point Average (CGPA) are computed. The computation of SGPA & CGPA, is as under:

Semester Grade Point Average (SGPA) is the weighted average of points obtained by a student in a semester and is computed as follows:

$$SGPA = \frac{U_1 \times M_1 + U_2 \times M_2 + \dots + U_n \times M_n}{U_1 + U_2 + \dots + U_n}$$

Where $U_1, U_2, \dots$ are subject credit of the respective course and $M_1, M_2, \dots$ are the Grade Points obtained in the respective subject (out of 10)

The Semester Grade Point Average (SGPA) for all the four semesters is also mentioned at the end of every semester.

The Cumulative Grade Point Average (CGPA) is used to describe the overall performance of a student in the course and is computed as under:

$$CGPA = \frac{\sum_{n=1}^4 SGPA(n)C_n}{\sum_{n=1}^4 C_n}$$

Where SGPA (n) is the nth Semester SGPA of the student and C_n is the nth Semester total credit. The SGPA and CGPA are rounded off to the second place of decimal.

XI Internal Evaluation Method :-

- (i) At the beginning of each course, every teacher shall inform his/her students unambiguously the method he/she proposes to adopt for the continuous assessment. Normally the teacher concerned may conduct three written sessional examinations spread periodically during the semester and select best two for contributing to the final marks.
- (ii) At the end of each semester the Departmental Committee shall assign grades to the students.
- (iii) The Departmental Committee shall prepare the copies of the result sheet in duplicate.

23

- (iv) Every student shall have the right to scrutinize answer scripts of sessional/end-semester examinations and seek clarifications from the teacher regarding evaluation of the scripts immediately thereafter or within 3 days of receiving the evaluated scripts.
- (v) The Department shall display the grade points and grades for the notice of students.
- (vi) The department shall send all records of evaluation, including sessional evaluation, for safekeeping to the Controller of Examinations as soon as all the formalities are over.

XII. Grade Card

The University shall issue at the beginning of each semester a grade card for the student, containing the grades obtained by the student in the previous semester and his Semester Grade Point Average (SGPA).

The grade card shall list:

- (a) the title of the courses along with code taken by the student
- (b) the credits associated with the course,
- (c) the grade and grade points secured by the student,
- (d) the total credits earned by the student in that semester.
- (e) the SGPA of the student,
- (f) the total credits earned by the students till that semester and
- (g) the CGPA of the student (At the end of the IVth Semester).

XIII At the end of the IVth semester, the University shall issue the statement of marks to the Students showing details of marks obtained by the student in each Head in each semester along with grade total marks.

XIV. Power to modify and remove difficulties :-

1. Notwithstanding anything contained in the foregoing, Hon'ble V.C. in consultation with the Dean of the faculty shall have the power to issue directions or orders to remove any difficulty,
2. Nothing in the foregoing may be construed as limiting the power of the University to amend, modify or repeal any all of the above.

This major release of radioactive elements into the environment has had a lasting impact on the environment.

Historical Context

The March 11, 2011, Great East Japan Earthquake and tsunami sparked a humanitarian disaster in northeastern Japan and initiated a severe nuclear accident at the Fukushima Daiichi nuclear plant. Three of the six reactors at the plant sustained severe core damage and released hydrogen and radioactive materials. Explosion of the released hydrogen damaged three reactor buildings and impeded onsite emergency response efforts.

The accident at the Fukushima Daiichi nuclear plant was initiated by the March 11, 2011, Great East Japan Earthquake and tsunami. The earthquake knocked out offsite AC power to the plant and the tsunami inundated portions of the plant site. Flooding of critical plant equipment resulted in the extended loss of onsite AC and DC power with the consequent loss of reactor monitoring, control, and cooling functions in multiple units. Three reactors sustained severe core damage (Units 1, 2, and 3); three reactor buildings were damaged by hydrogen explosions (Units 1, 3, and 4); and offsite releases of radioactive materials contaminated land in Fukushima and several neighboring prefectures. The accident prompted widespread evacuations of local populations and distress of the citizenry, large economic losses, and the eventual shutdown of all nuclear power plants in Japan.

Personnel at the Fukushima Daiichi plant responded with courage and resilience during the accident in the face of harsh circumstances; their actions likely reduced the severity of the accident and the magnitude of offsite radioactive material releases. Several factors prevented plant personnel from achieving greater success—in particular, averting reactor core damage—and contributed to the overall severity of the accident:

Geographical Context

The Fukushima Daiichi Nuclear Power Plant (Fukushima Daiichi Genshiryoku Hatsudensho) is a disabled nuclear power plant located on a 3.5-square-kilometre (860-acre) site[1] in the towns of Ōkuma and Futaba in Fukushima Prefecture, Japan.

The area around the nuclear power plants contains highly contaminated solid. The map shows the cumulative load. As an example: the maximum accepted value of 1 millisievert per year (mSv/y) was exceeded 427 times in the village of Namie (until February 2015).

An area of 600 km² around the nuclear power plants were contaminated with about 600 kBq/m² -the limit for permanent resettlement by the Russian authorities after the Chernobyl disaster.

The Japanese government has decided to scrape off the top layer of soil (5 cm depth), in order to reduce the radiation exposure to a maximum of 1 mSv/y. This must be done in an area of 2000 square kilometers, therefore 100 million cubic meters of radioactive soil has to be removed – and safely stored.

The plant is on a bluff which was originally 35 meters above sea level. During construction, however, TEPCO lowered the height of the bluff by 25 meters. One reason for lowering the bluff was to allow the base of the reactors to be constructed on solid bedrock in order to mitigate the threat posed by earthquakes. Another reason was the lowered height would keep the running costs of the seawater pumps low. TEPCO's analysis of the tsunami risk when planning the site's construction determined that the lower elevation was safe because the sea wall would provide adequate protection for the maximum tsunami assumed by the design basis. However, the lower site elevation did increase the vulnerability for a tsunami larger than anticipated in design.

Case Site Analysis

Effects on Alive - Because of released substances, many health problems have occurred. Depression, anxiety, and PTSD were not the only notable mental health concerns that came out of the Fukushima nuclear disaster. Other mental health issues that came out of the event include increased suicide risk. One of the most severe long-term effects the survey found is an increase in rates of suicide.

Effects on Social Life - Homes which are located 30 km around of Fukushima have been evacuated.

Effects on Economy -At the end of the accident, financial losses reached approximately 150 billion Euro.

Effects on Environment- After the disaster, released substance damaged the environment.

Environmental Effects of Fukushima Disaster

Impact on Land: -

One of the primary isotopes that was released by the meltdown of the nuclear reactor was Cs-137. Initially discharged into the atmosphere, Cs-137 was brought to the surface by dry and wet deposition. Cs-137 has a half-life of 30.1 years, so Cs-137 absorbed in the top soil layer can remain there for many years. This contamination of the soil is especially concerning due to its deleterious effect on stock farming and agriculture, and its potential impacts on human health. The soils around Fukushima have been contaminated with depositions of more than 100,000 MBq km

Impact on Water: -

The waters around Fukushima were also subject to nuclear contamination. In addition, soil, Cs-137 in the atmosphere was also deposited in the Pacific Ocean. Furthermore, seawater was used to help cool the damaged reactors following the earthquake, and the release of this highly contaminated water led to radioactive discharges directly into the sea. Not only were radioactive isotopes released into the ocean, other nonvolatile activation products and fuel rod materials were also released as they made contact with water. A study on levels of Cs-137 and other radioactive isotopes in the ocean water near the discharge point has shown that not only were there significantly elevated concentrations, but the timing of the peak of the concentrations was approximately one month.

Conclusion

The Fukushima Daiichi nuclear reactor meltdown caused the largest accidental source of radionuclides in the ocean, and atmospheric and soil contamination comparable only to the Chernobyl nuclear power plant disaster. Studies on the extent of this contamination, such as those described above, have been useful for the establishment and monitoring of regulatory measures, and for guiding of activities to lessen the impact of the contamination.

Furthermore, this event has led to international collaborations for comprehensive field measurements to better understand the extent and impact of nuclear contamination, and hopefully better guard against potential accidents in the future. And consequently, more than 100,000 people remain evacuated from the region surrounding the plant, as officials work to contain radioactivity and decommission the plant — a process they estimate could take decades. Much of the contaminated land will also be uninhabitable for at least 20-40 years.

UNIT TEST-5

BSc Sem VI (PHYSICS) Date: 29/07/2021

Unit V: Magnetic Properties of Materials

* Required

1. Email *

2. Full Name (First name, Middle name, Surname) *

3. Group *

Check all that apply.

- ☐ PCM
- ☐ PHG
- ☐ CAM
- ☐ CMP
- ☐ CAP

4. Mobile *

5. 1. Which of the following is true? *

1 point

Mark only one oval.

- ☐ a) Diamagnetism is temperature dependent
- ☐ b) Paramagnetism is temperature dependent
- ☐ c) Paramagnetism is temperature independent
- ☐ d) None of these.

8/22/21, 2:03 PM

UNIT TEST-5

6. 2. Diamagnetic substance are those having a permeability *

1 point

Mark only one oval.

- ☐ a) more than free space
- ☐ b) less than free space
- ☐ c) equal to free space
- ☐ d) much greater than free space

7. 3. Magnetic susceptibility in diamagnetic material is *

1 point

Mark only one oval.

- ☐ a) Neutral
- ☐ b) Negative
- ☐ c) Positive
- ☐ d) Zero

8. 4. If the permeability is high, the hysteresis loss is *

1 point

Mark only one oval.

- ☐ a) Zero
- ☐ b) Infinity
- ☐ c) High
- ☐ d) Low

9. 5. Above Curie point *

1 point

Mark only one oval.

- ☐ a) a ferromagnetic material becomes paramagnetic
- ☐ b) a ferrite becomes an insulator
- ☐ c) a insulating material becomes a ferrite
- ☐ d) a diamagnetic material becomes a paramagnetic material.
